Oklo Resources identifies gold trends over 4 kilometres in length at Kouroufing in Mali

Oklo Resources Ltd (ASX:OKU) has outlined new robust gold anomalies of over 4 kilometres in length and received many plus-0.5 g/t gold results in a recent program of reconnaissance shallow geochemical auger drilling at Kouroufing project in Mali.

There were 1,588 auger holes for 22,650 metres completed, revealing potential gold-bearing structures in northeast and northwest orientations south of a previously identified 6-kilometre gold corridor.

The results enhance the potential for further bedrock gold discoveries at Kouroufing with multiple anomalies earmarked for deeper aircore (AC) drilling.

Oklo managing director Simon Taylor said: "These new shallow geochemical results highlight the potential for additional gold-bearing structures along favourable northeast and northwest trends, complementing the recent greenfields discovery within the main Kouroufing gold corridor which has already yielded a number of significant gold intersections from AC drilling.

"Planning is underway for a program of follow-up AC drilling on a number of the higher priority geochemical and IP geophysical targets."

Best composite Kouroufing South intersections include 11 metres at 1.09 g/t from 7 metres, 6 metres at 6.97 g/t from 7 metres, 4 metres at 3.59 g/t from surface, 6 metres at 1.12 g/t from surface and 4 metres at 1.09 g/t from 12 metres.

The auger holes were drilled to an average hole depth of 15 metres at 100-metre centres on 400-metre spaced lines.

Three composite samples of variable thickness were collected from each hole representing the laterite, transition and saprolite horizons.
